

The images illustrate the seventeen sections used to create the form of the visitor centre. Subtle changing and morphing of the section create complex interesting internal spaces and volumes. Once the sections have been assembled and post-tensions they form an efficient beam capable of spanning the ravine where the project is sited.

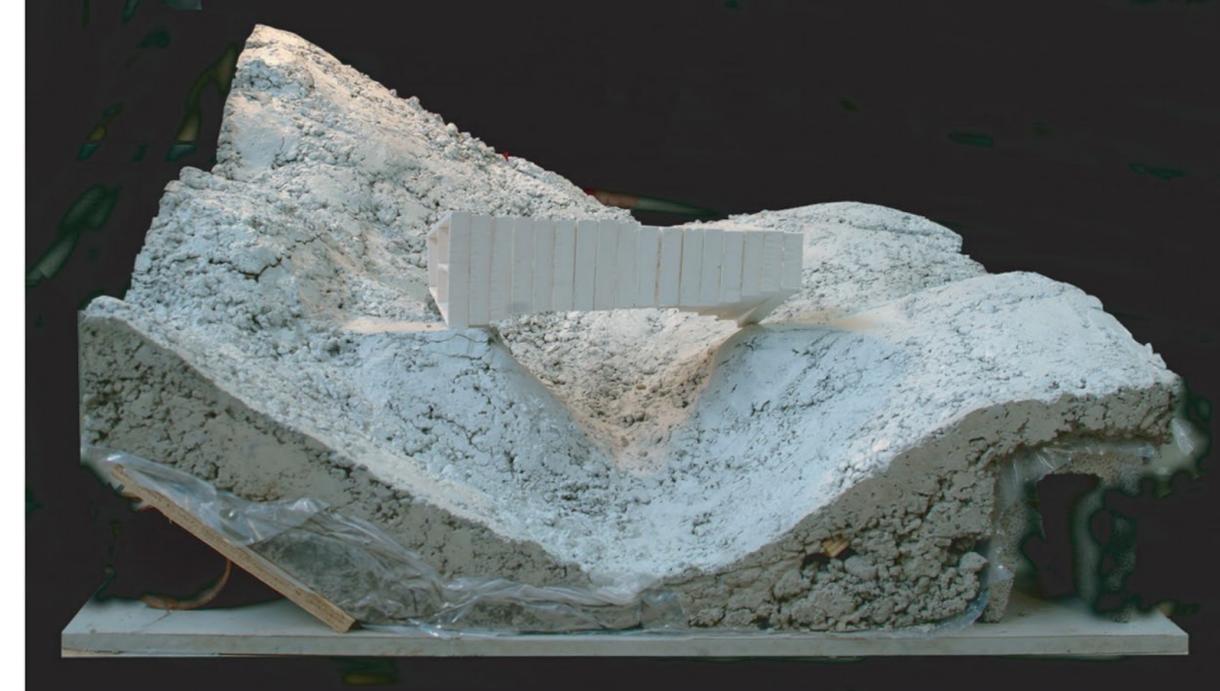

Section A-A

3D image of assembled building

Plan B-B

Images of the 17 concrete sections post-tensioned together and spanning the ravine on the site. The building forms a bridge across the ravine and once inside the building the views of the alpine region are framed by the large opes at it's ends.
